XRPL Lending Protocol Hackathon / 13 September 2026

The first obstacle: connecting to the ledger

The first difficulty was the connection to the ledger. I suspected that a firewall on the Wi-Fi was blocking access. Switching to a phone hotspot restored the connection, although we did not confirm that a firewall was the cause.

The problem I wanted to solve

I wanted to work out how to coordinate lenders and borrowers using AI: how to match the availability of funds with a request to borrow, and make that process simple to understand.

What surprised me

What surprised me was realizing that we could start building an application with the potential to change things in just one week.
